

Wall switch **converter**

SH4-90604 | Problem solving innovation on the market

A thin white vertical line with a small white dot at the top, extending from the text area down towards the bottom of the page.

Wall switch converter is a small (two-piece) built-in device to place behind your traditional light switch.

Make your wall switch **smart**

Offering a solution in user experience

You open your app and want to switch on the smart lighting in the living room. But it doesn't work... What is this? It turns out your friend has switched your lights off with the traditional wall switch. As a result there is no power on the light source anymore. Switching by phone does not work now.

Pretty inconvenient.

“Every consumer that uses smart bulbs has this problem, regardless of the brand”

Smartwares has a solution for this problem:

The new solution from Smartwares is a small sized, built-in wall switch converter that makes sure your smart bulbs always have power. Your smart home will never be offline again. Your traditional switch simply becomes a smart switch, and with it you are able to control any smart light in the way you want through the Link app (or Philips Hue).

Power on

Built-in converter that always keeps power on your smart lights due to the small battery inside. Never the surprise of an offline bulb again.

Smart switch

Be able to always use either the traditional wall switch or your phone to use the smart bulbs.

Small size

Small design; easy to install and fits in every wall switch installation box. This way you do not need to change your existing (design) switching materials.

The-wall-switch-*what?*

Built-in solution

Invisibly installed behind your own wall switch.

All the smart bulbs in the market are usually controlled with smartphone. To be able to do this for your wired ceiling and wall lights, you always need power and the light switch on.

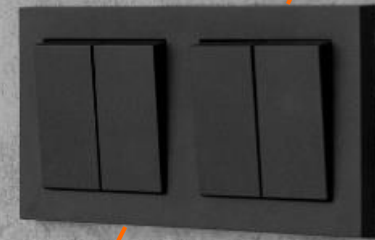

If it's just you who lives in your home (or maybe also a spouse), you know to keep the light switch turned on and not mess with it. However, if you have kids (or guests over frequently), it's a bit more difficult to keep that switch untouched. Not to say impossible.

We offer a solution by making your current wall switch smart!

With a very small built-in unit the traditional wall switch converts to a smart switch. When installed, you can have control of your lights with your phone, even when the wall switch is switched off. At the same time, the traditional wall switch can be used to control more or other smart lights, or to activate presets.

Small size fits all

Keep your traditional (design) switches
